

Open PlungeMAX and Place on Seat rim

Place it so that the short end is flushed between the two seat holding bolts and is touching the seat rim

Hold PlungeMAX and Seat/Lid together vertically While ensuring that the short edge of the PlungeMAX continues to rest on the seat rim

Move down the seat/lid and PlungeMAX together ensuring that the bottom of the PlungeMAX stays in place to make a Plunge  
The base of the PlungeMAX will rest on the seat rim sealing it and compressed air escaping through the bottom three holes into the toilet bowl  
(This is the critical part – if the bottom of the PlungeMAX shifts during this action – the seal will be compromised and the air will escape without plunging)
